Industry Report

Semiconductor/Semi Cap 2Q Earnings Preview: Plenty of Juice Left to Squeeze

Following a return to "risk on" for Semiconductor stocks in early-April, the SOX is now +92% YTD — begging the question of whether there is still more juice to squeeze. The short answer is an unequivocal YES. The current AI Infrastructure build-out is the product cycle of our lifetime, and with meaningful constraints across the Semiconductor supply chain, we view this *cycle as both durable and elongated*, and where we have been discussing a path to $3T in Semi revs into CY30, we now see that achievable in CY29, with $3.5B+ likely by CY30. ***In this world, our Top Picks are***: **MU** & **SNDK** in Memory, **WDC** & **STX** in Storage, **NVDA**, **AVGO**, & **AMD** in AI Compute, and **ASML**, **AMAT**, **LRCX**, **KLAC**, **TER**, **MKSI**, & **ONTO** in Semi Cap.

Top Ideas into 2Q Earnings: Long AMD, MU, SNDK, ASML, MKSI, and ONTO. *We offer additional tactical ideas inside...*

Top 10 Themes into Earnings: **1)** TSMC Constraints Continue to Support a Durable and Elongated AI-Led Cycle (and Path to $3T in Semi Revs by CY29); **2)** When Will Market Leaders NVDA and AVGO Work Again? Will Smaller Share Accelerator Players Continue to Outperform?; **3)** Is it Too Late to Buy Intel?; **4)** Look for Continued Better than Seasonal Analog Guides Through the end of CY26; **5)** Memory – Supply/Demand Only Getting Worse in 2027, Goldilocks to Continue; **6)** HDD Storage – Buy Them Both (Still Not Pricing in Normalized Earnings Power); **7)** Large Cap Semi Equipment is Dreaming a Bigger Dream; **8)** SMID Cap Semi Equipment a Beneficiary of the Dream as Well; **9)** Long-Term Story for Teradyne Robust; Near-Term More Balanced; and **10**) Mature Node Environment Set Up to Be Tight into CY27 And Beyond.

Stretch Goal EPS: Inside, we have run through stretch goal EPS for each of our names - we highlight the following CY28 earnings power: **NVDA** $21, **AVGO** $30, **QCOM** $12, **AMD** $28, **INTC** $6, **MRVL** $10, **NXPI** $20.50, **MCHP** $6, **ON** $6, **ADI** $20, **TXN** $12.50, **MU** $200, **SNDK** $250, **WDC** $44, **STX** $64, **MKSI** $26, **AEIS** $20, **ONTO** $15, **NVMI** $18, **CAMT** $5.50, **TER** $26, **FORM** $5, and **GFS** $4. For large cap SPE, we look to CY30, where we see stretch EPS: **AMAT** $48, **ASML** €120, **LRCX** $25, and **KLAC** $15. *See inside for more details.*

Price Target Updates: Along with our stretch goal EPS analysis, we are updating a number of price targets: **ADI** to $550, **AEIS** to $450, **AMAT** to $850, **AMD** to $700, **ASML** to €2,500, **INTC** to $150, **KLAC** to $325, **LRCX** to $500, **MRVL** to $300, **MKSI** to $600, **NXPI** to $400, **ON** to $110, **ONTO** to $410, **STX** to $1,300, **TER** to $550, **TXN** to $340, and **WDC** to $900.

Semiconductor/Semi Equipment 2Q26 Earnings Preview: There is Still Plenty of Juice Left to Squeeze

Following a return to "risk on" for Semiconductor stocks in early-April, the SOX is now +92% YTD — begging the question of whether there is still more juice to squeeze. The short answer is an unequivocal YES. The current AI Infrastructure build-out is the product cycle of our lifetime, and with meaningful constraints across the Semiconductor supply chain, we view this *cycle as both durable and elongated*. Hyperscaler capex is on track to surpass $1 Trillion in 2026, with 75% directed to AI infrastructure, propelling global Semiconductor revenues toward $1.6T. We are currently token-maxing notwithstanding a ~90% decline in cost per token per year – Hello Jevon's Paradox! Agentic AI is just getting started, where Enterprise AI is broadly adopted but barely deployed at scale — with fewer than 1 in 8 companies running agents in production. Thus, the largest deployment backlog in enterprise technology history is about to hit the Semiconductor supply chain – likely sustaining excellent top-line growth through CY30 at a minimum. We had been discussing a path to $3T in Semi revs into CY30, but we now see that as achievable in CY29, with $3.5B+ likely by CY30.

Semiconductor stocks are obviously meaningfully more expensive vs. 3 months ago. That said, when reflecting on our CY28 stretch EPS estimates, we would easily make the argument that as long as this cycle is durable (i.e., 2028 is not peak), that valuations for many names continue to screen inexpensive and well-below the S&P 500. Moreover, we highlight a strong fundamental backdrop where consensus estimates will continue to push higher, supporting sustained outperformance.

A quarter ago, we outlined a vision for top-performing categories of Memory/Storage first, Compute second, and Semi Equipment third. This largely played out, with sub-system Semi Equipment players outperforming Compute (as inventory is getting built in the channel), while the Large Cap Semi Equipment companies perhaps lagged a little more than expected because of clean-room constraints (simply no place to deliver the equipment). As we look ahead, we see "more of the same" with Memory/Storage, Compute, and Semi Equipment continuing to lead the group higher.

Our Top Picks remain unchanged: Our Top Picks are **MU** & **SNDK** in Memory, **WDC** & **STX** in Storage, **NVDA**, **AVGO**, & **AMD** in AI Compute, and **ASML**, **AMAT**, **LRCX**, **KLAC**, **TER**, **MKSI**, & **ONTO** in Semi Cap.

As for earnings, our best ideas include the following: 1) We believe AMD offers the greatest momentum in Compute, though we view both NVDA and AVGO as simply too inexpensive to ignore (despite funding shorts for HF's). On the other hand, recently debuted Compute play QCOM could revert back to a Smartphone story (at least near term) where we continue to see downside vs. consensus. **2)** In Memory, we see the most upside for MU and SNDK, though continue to like WDC and STX as the HDD industry continues to re-rate (here, we see greatest color from SNDK on LTA's as an important positive catalyst, as well as heading into August Analyst Day). **3)** In Analog, we continue to see greater upside in AI-levered areas (i.e., memory, compute, SPE), though those with leverage to power, pricing, and/or capacity will likely remain relative buyside longs within the group. We would highlight that for those with some duration, ADI, MCHP, and NXPI screen particularly attractive as out of favor names today. **4)** In Semi Equipment, we see the most EPS upside from ASML. Considering being a significant underperformer, we see a meaningful catch-up trade here. We do continue to like LRCX, AMAT, and KLAC, but we see more limited upside to EPS here (we could see modest relative underperformance here through earnings like we did last earnings season). **5)** In SMID Cap Semi Equipment, we continue to favor MKSI and ONTO as Top Picks, with AEIS up next in our rankings here (leverage to WFE Cycle + DC power). **6)** In Semi Test, we balance a robust LT secular story with likely very limited upside to consensus – we would be better buyers NT on reset. **7)** In Foundry, we continue to see GFS grinding higher, with potential for ASP uplift as clear risk to upside.

Strong Stock Performance YTD, But Let's Not Forget the Strong Fundamental Backdrop Buttressing These Trends

Semi performance YTD has been driven not only by multiple revisions, but also a material change in EPS estimates across nearly every sector. Performance has been led by Memory with a median return of 315% YTD, which has been supported by CY26/CY27 EPS estimates increasing 95%/175%, respectively. Other notable outperformers include Subsystem suppliers (+174% YTD) that have seen CY26/CY27 EPS estimates rise 60%/67% at the median. One of the most interesting dynamics is occurring in Compute, where NVDA and AVGO have seen both CY26 & CY27 EPS estimates rise at or above the median for the group; the names have dramatically underperformed YTD (+8%/+10% respectively vs. +156% at the median). The material underperformers have come from the Mobility space (YTD performance of -1%) that at the median have seen CY26 EPS estimates unchanged, with CY27 coming down -1%.

Exhibit 1: Median Changes in Estimates vs. Performance in Semis

Group	YTD Δ CY26 Revenue	YTD Δ CY26 EPS	YTD Δ CY27 Revenue	YTD Δ CY27 EPS	Performance YTD
Memory	+53%	+95%	+100%	+175%	315%
Subsystem	+15%	+60%	+23%	+67%	174%
Compute	+14%	+16%	+30%	+35%	156%
Large Cap SPE	+20%	+33%	+26%	+38%	121%
Small Cap SPE	+10%	+7%	+15%	+27%	121%
Networking	+18%	+25%	+29%	+38%	101%
Analog	+10%	+17%	+11%	+17%	100%
Mobility	-1%	0%	0%	-1%	20%

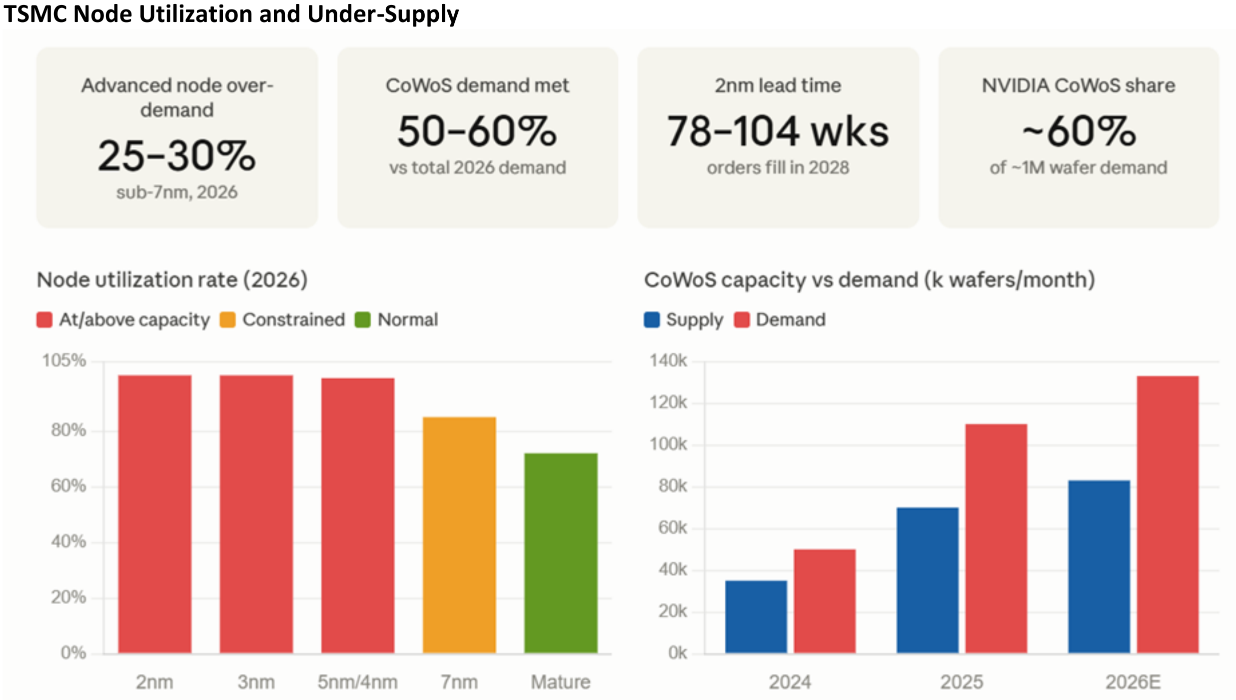
Areas of Focus – Top 10 Themes to Watch into 2Q26 Earnings

1. TSMC Constraints Continue to Support a Durable and Elongated AI-Led Cycle (and Path to $3T in Semi Revs by CY29)

Despite being on track to grow revenues by 40+% in CY26, TSMC continues to be one of the main bottlenecks for the Semiconductor industry today. In fact, if TSMC were being 100% honest, they would tell you that both 2026 and 2027 are now sold out, with the company building backlog for 2028 and beyond. In turn, this is having a meaningful impact elsewhere in the Semiconductor industry. First and foremost, this is constraining today's AI compute build and supportive of a more durable and elongated AI cycle. This is a good thing, in our view. Second, we believe this puts us on a path to reach $3 Trillion in Semiconductor revenues, most likely in 2029. That's a ~25% CAGR – if right, too early to get off the Semiconductor bandwagon. Third, tightness at TSMC is creating haves and have-nots (TSMC favoring AI over Smartphones) and driving customers to now clamor for a second source, driving new customer orders for front-end wafers at both Samsung and Intel. Fourth, this is spurring a step-up in WFE demand, where we believe TSMC will account for 40-50% of ASML's EUV tools in CY27 (Capex budget of $80-90B – though don't think TSMC unveils CY27 Capex on this call), but this will still not be enough to satiate demand. In turn, this is driving today's great visibility to WFE growth well into 2027, 2028, 2029, and beyond. And fifth, this compute-constrained phenomenon will create winners and losers as it relates to who has access to TSMC wafers. Here, we believe TSMC is championing 2 of its 3 largest customers – NVDA and AMD – where we would expect over-allotment of wafers. Thus, we view NVDA and AMD as the incremental winners here.

Exhibit 6: TSMC Node Utilization and Under-Supply



Source: Cantor Fitzgerald

2. When Will Market Leaders NVDA and AVGO Work Again? Will Smaller Share Accelerator Players Continue to Outperform?

Compute has been a top performer in CY26, though we have seen a seismic shift in relative performance with leaders NVDA and AVGO taking a back seat, with smaller participants in the Accelerator market outperforming more recently, led by MRVL, AMD, as well as INTC. Looking to 2HCY26, we highlight a rising tide for all of compute (as compute is sold out globally), coupled with the following company-specific thoughts…

- **AMD:** We see AMD as offering the greatest sustained positive momentum into earnings, as the company benefits from Agentic AI-led CPU growth, coupled with fast-growing XPU into CY27 and beyond. Our work now suggests Data Center revenues on track to approach $70B in CY27, well-above current cons of $55B. Here, we highlight CPU and XPU each tracking to ~$35B, with Agentic AI a key driver. For CPU, we are seeing focus on RAS/security favoring x86 over ARM and AMD benefitting from added capacity at TSMC. Layer in added ASP uplift from Venice (we are hearing 25% of total mix of 15-17M units) and $35B appears very doable. Layer in a similar amount of XPUs and we see path to $20+ in EPS in CY28 (cons $15.71), followed by $28 in CY28 (cons $21.90).

- **NVDA:** The AI Accelerator leader has been a significant underperformer YTD, largely due to peaking market share fears. This said, it is worth highlighting still 70+% revenue market share in all of AI and that the recent inclusion of Anthropic (where historically NVDA did not participate) should enable the company's share of Inference to grow (and not decline). Finally, we see a clear path to $21 in EPS in CY28, highlighting shares at only 10x earnings. Our sense is hedge funds are using NVDA as a funding short and LO's are underweight. We aren't sure what the catalyst is (another beat, more meaningful buyback, confirmation of GMs notwithstanding higher HBM pricing), but at this valuation, we think it pays to simply wait.

- **AVGO:** The #2 AI Accelerator player has also been a significant underperformer in CY26, due to fears about Google attempting to adopt Customer Owned Tooling over time and near-term designing in MediaTek for additional SKUs. Lack of mgmt. upsizing the AI revenue opportunity for FY27 on the last earnings call was also a negative. This said, we do believe AVGO remains on track to ship ~10GW in FY27, supporting AI revenues of $150B. Moreover, as we look for rising GW and higher ASPs (led by both Google and Meta), we see AI revenues tracking to 30-50% Y/Y growth supporting $30 in EPS into the CY28 time frame. At just 13x, AVGO also pays to wait.

- **MRVL:** Marvell has moved to a disciplined approach, offering precise guidance for both CY26 and CY27, with expected sustained growth into CY28. Near-term upside is more limited and we doubt mgmt. will give too much information near term on CY28. For CY27, mgmt. has been signaling perhaps more upside for Optical, but Custom Silicon likely fully dialed in (thus perhaps CY27 EPS upside to $6.50-7.00 vs. current cons of $6.00). Nevertheless, at 40+x CY27 earnings, upside for shares will require a vision for meaningful upside to CY28 where we see earnings power of $10 (includes growth in Trainium/Maia, new Google offering, and Optical growth). But at 30+x, we simply see better upside elsewhere. $12+ would get us more excited and we doubt management will provide this kind of granularity, at least in the coming few quarters.

- **QCOM:** Qualcomm's recent Investor Day provided the blueprint for the company's emerging DragonFly portfolio and the go-forward strategy, which includes $5B in FY27 Data center revenues (led by Custom Silicon and XPU) and $15B in FY29 revenues. We remain in the wait and see camp, as this is a highly competitive field and we have questions across each of the four roadmaps (CPU, XPU, Custom Silicon, & Networking). As a result, we model $7.5B in FY29 DC revenues and remain laser-focused on any material updates on customer traction and benchmark performance vs. existing solutions.

3. Is it Too Late to Buy Intel?

An Important Inflection for Confidence in 18AP/14A, as Evidenced by Higher Capex in CY27: Lip Bu told us on April 23rd that the timing of a Capex inflection would indicate confidence in the company's 14A ramp. With our work suggesting Intel is trying to pull-in equipment deliveries in CY26 (unsuccessfully unfortunately), look for a robust Capex outlook for CY27 outlined this earnings cycle as an incremental positive for shares. Here, we highlight 18A Fab 52 is in production (Panther Lake for PCs) and at VLSI 2026, the company highlighted that 18A-P has entered risk production (+9% improvement in performance and 18% reduction in power consumption), which suggests that 18A-P is ready for HVM into 2027. During conference season, the company indicated that 14A is tracking well, with 0.9 PDK availability slated for October of this year, and paving the way towards risk production in late-2027/early-2028. Beyond this, there is clear investor excitement around confirmed customer wins, including Apple (risk production on 18A-P for Macs, where reports suggest Apple could ramp towards >7k wspm), NVDA (potential for base die/networking silicon), Tesla, Google, as well as current 18A customers MSFT/AMZN. More near term, look for announcements around material Advanced Packaging wins (where we believe that AMZN, Google, and MSFT could exceed $1B/year), coupled with progress in evaluations by major companies, as important catalysts.

Expect Modest Beat and Raise into Earnings: We expect a modest beat and raise, largely driven by better pricing as unit supply remains constrained. We look for upside to be driven by DCAI, which should deliver modest upside to both GMs and EPS as well.

Agentic AI Server CPU-Led Demand a Key to Internal Production & Earnings Momentum: At a higher level, we are still very early in the Agentic AI CPU demand story, with a vision to material upside to AMD's previously discussed $120B by CY28 – more like $150B? $175B? That is the direction we are going. There are three major areas for server CPUs: **1)** traditional enterprise, **2)** head nodes for GPU/XPU attach, and **3)** CPU-only racks for agentic AI. Within traditional enterprise compute, we expect this sub-segment to remain relatively steady, marked by modest growth as units remain flattish and ASPs grow slightly. Demand for head nodes is where the industry is seeing the largest near-term impact, where high frequency, high single-threaded performance, lower core count, and memory bandwidth are key drivers of demand. Lastly, the server-only racks are expected to lead to a significant uptick in demand over the coming years, which will be used to run code for agents, with AMD highlighting that this area could reach 50% of the server CPU TAM. Within this, multi-threaded performance and high core count are the most beneficial, with RAS/security features remaining a critical part of hyperscalers' decision-making process (favoring x86 over ARM). Putting it all together, this is a meaningful growth driver for Intel into CY27 and beyond (NT focus on wafer availability, and then also fix multi-thread roadmap with Corak Rapids in 2028 as challenges to overcome).

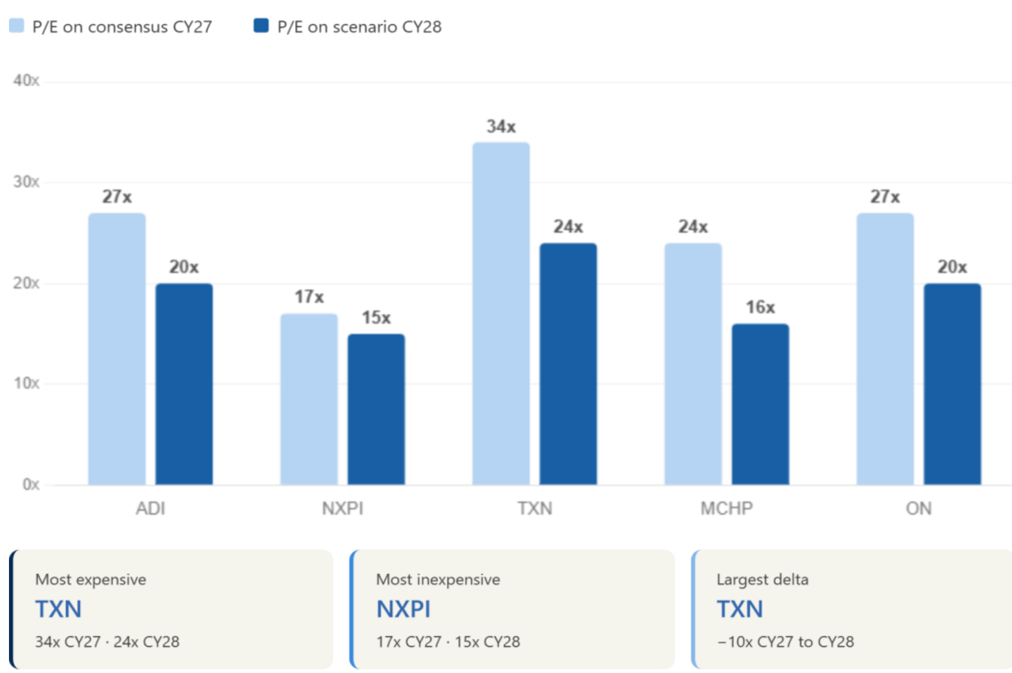
See Path to $6 in EPS into CY30 Time Frame: We outline a scenario where Intel could earn $6 in EPS by CY30, and significantly above consensus estimates of $1.09 in CY26. Underpinning our assumption includes significant growth in server CPUs (where AMD has noted that its $120B provided last quarter is likely quite conservative), and where we assign a TAM of $150B (with Intel receiving 45% of share) and leading to DCAI revenues (server plus other DCAI) of $73.5B, or a +34% 5-year CAGR (CY25-CY30). This is coupled with modest +3%/+10% CAGRs for CCG /Foundry, ~50% incremental GMs in CY28-CY30 (leading to GMs of 44%), and modest Opex/share count growth of +3%. While there is still much wood to chop, we are beginning to see light at the end of the tunnel (largely due to agentic tailwinds, partially due to progress in Foundry). To that end, we are raising our target price to $150 from $90, now based on a 25x multiple of potential $6 in CY30 EPS.

NT Share Bias Higher, See Upside to $150: With shares in the low-$130's, this would suggest still more incremental upside, though we do highlight that positive confirmation of survival, fundamentals will matter. We think that will be the 2027 story for Intel.

4. Analog – Looking for Continued Better than Seasonal Guides Through the End of CY26

From a fundamental perspective, our work suggests that the Analog group is set up for above-seasonal growth in the back-half. Cyclical KPIs continue to screen positively across bookings, lead times, and inventories, with pricing increases expected to act as a tailwind through the remainder of the year. End-market demand in cyclical areas is generally showing gradual improvement, varying by segment (i.e., Industrial better, Auto slightly better, Consumer slightly worse), with continued robust secular growth in areas such as A&D, Data Center, and other AI-levered areas. *So overall, the backdrop for Analog remains generally positive, and we expect this to support beats/raises across the group*. From an investor-positioning perspective, all focus today is on those with leverage to power, pricing, and/or capacity – creating a have vs. have-nots paradigm where we believe general positioning within Analog is *Long* **TXN**, **ON**, **STM**, and **IFX**, *Short* **MCHP** and **NXPI**, and *Neutral* **ADI**. We would expect these themes and preferred exposure to likely hold through this upcoming earnings cycle, though also highlight that the low-hanging fruit from this trade has largely already been captured with TXN, ON, STM, and IFX trading at ~35x NTM consensus EPS on average. From here, we look at longer-term earnings power for opportunities – running a scenario analysis on CY28 EPS across our group (major focus today amongst our investor conversations remains on CY27; expect conversations to move to CY28 in the next 3-6mos). Through this analysis of driving "normalized" cyclical revenues plus accounting for strong growth in AI-levered areas, we arrive at the following CY28 stretch goal EPS: ADI $20.00 (cons $15.29 CY27), NXPI $20.50 (cons $17.66 CY27), TXN $12.50 (cons $8.94 CY27), MCHP $6.00 (cons $3.88 CY27), and ON $6.00 (cons $4.30 CY27). Utilizing these stretch goals, we see valuation support for continued upside across the group, with greatest upside from **MCHP**, **NXPI**, and **ADI** – all of which have compelling investment stories and are out of favor with investors today (**MCHP** – industrial overexposure, PCIe wins/ramps, best relative growth setup; **NXPI** – best value play, edge AI leverage, under-appreciated secular exposure/through-cycle resiliency; **ADI** – best-in-class asset, AI-related biz 19% of revs, under-appreciated power opportunity).

Exhibit 7: Analog P/E Multiples Based on Consensus CY27 and Our Scenario CY28 EPS



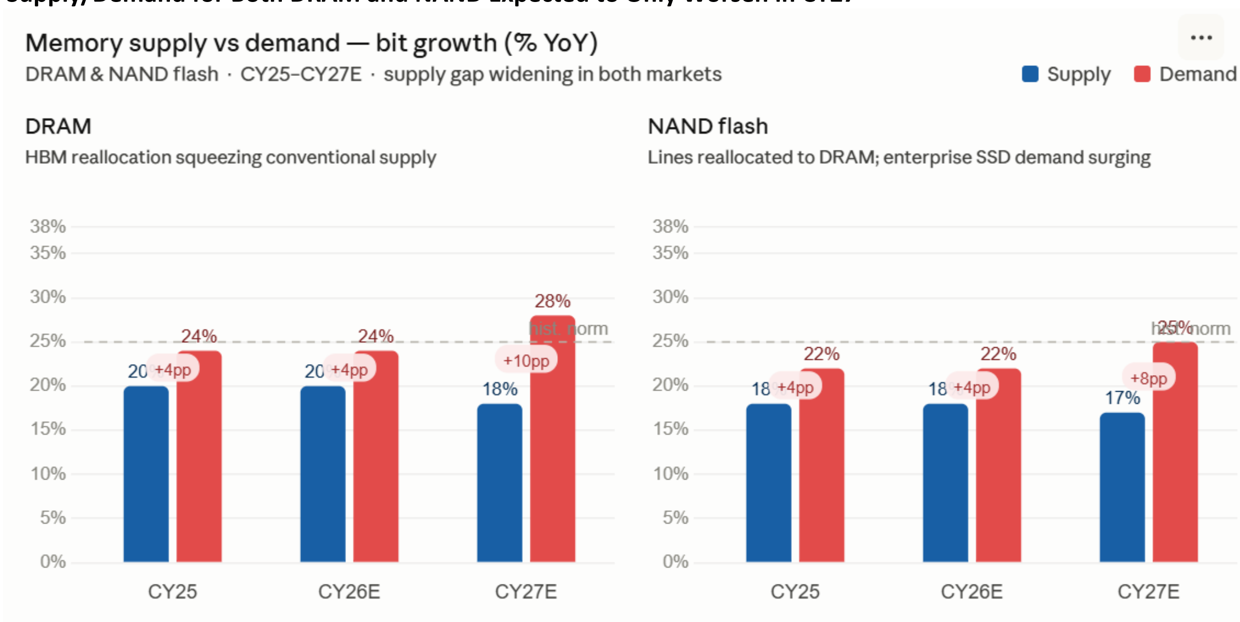
Source: Cantor Fitzgerald

5. Memory – Supply/Demand Only Getting Worse in 2027, Goldilocks to Continue

Memory continues to be a major gating factor (if not the largest) in the AI infrastructure build-out, as well as the broader compute landscape. Share price performance of memory companies have seen the most dramatic uptick in our coverage (if not within large cap stocks as a whole), with SNDK up over +4,600% in the last year and MU up +840% and eclipsing the SOX return of roughly +175% during the same time period. While fears remain around the potential of oversupply leading to a subsequent memory downturn, as well as peaking gross margins, we believe this cycle is just getting started, with the supply-dynamic outlook for both DRAM and NAND only GETTING WORSE IN 2027. In turn, we look for EPS to not only grow Y/Y in CY27 but also CY28, with the likely first signs of supply-demand balance (at the earliest) in CY29.

For DRAM, we are hearing 3Q contract pricing tracking +25% Q/Q, with no end in sight to price increases. The only question seems to be the impact of LTAs on the upward trajectory of pricing (MU's comments were VERY reassuring). Moreover, we look for a reset to HBM pricing to better match the margins of DDR5. For NAND, we are hearing 3Q contract pricing tracking +25% Q/Q as well, with again the main question also being the impact of LTAs. In turn, we see stretch goal EPS of $200 for MU and $250 for SNDK in 2027.

Exhibit 8: Supply/Demand for Both DRAM and NAND Expected to Only Worsen in CY27

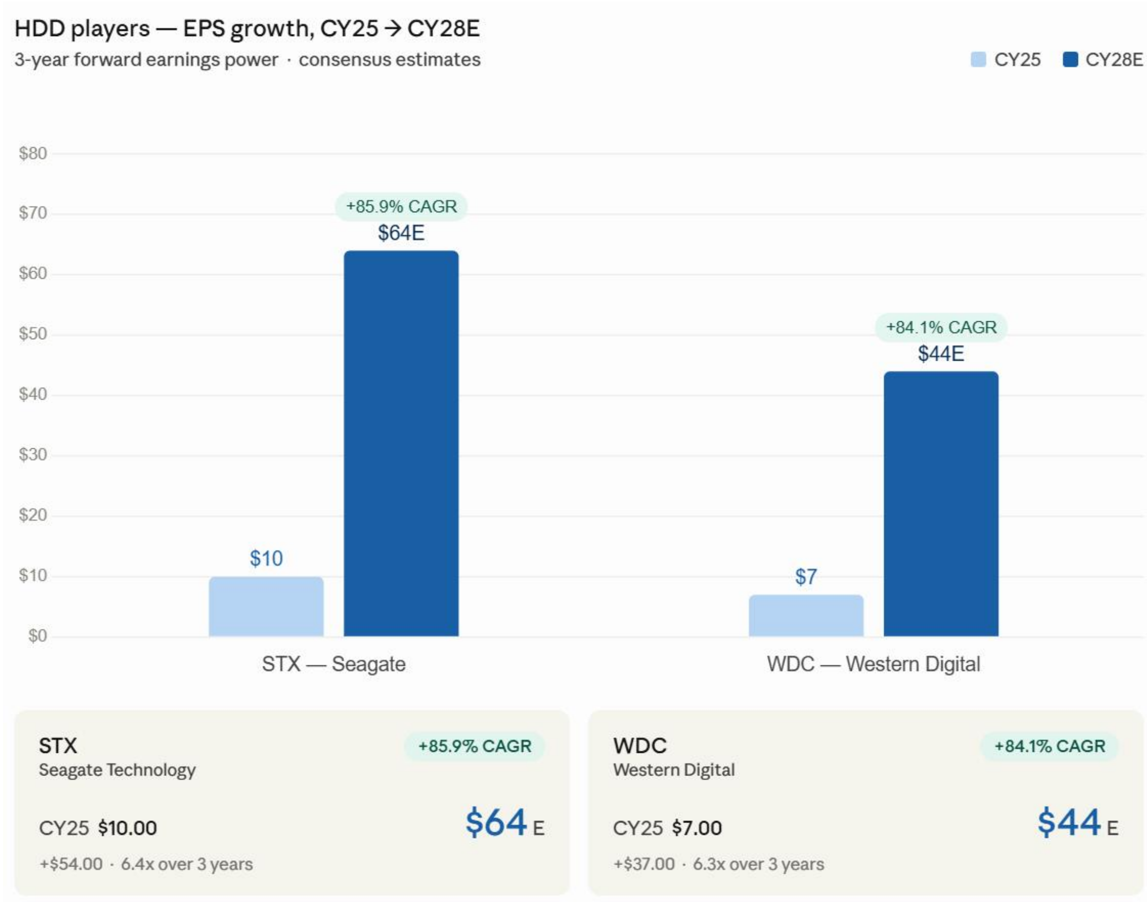


Source: FactSet, Cantor Fitzgerald

6. HDD Storage – Buy Them Both (Still Not Pricing in Normalized Earnings Power)

While the HDD complex has experienced significant outperformance since the beginning of the year (WDC/STX +350%/+295% YTD vs. SOX +102% YTD), we continue to believe that the secular tailwinds driving significant growth and profitability ahead remain under-appreciated. Long-term agreements are providing meaningful visibility into customer demand (extending several years out in some cases), and with agentic AI driving further need for storage and coupled with disciplined supply growth solely through technology transitions, we see a long runway for continued ASP expansion (both blended and on a dollar per TB basis). Beyond a tight supply/demand environment, additional pricing tailwinds will be led by a growing mix of high-value and high-capacity drives as HAMR adoption takes shape in the coming years. Looking ahead, revenue growth is clearly better than the industry (as well as the companies) had imagined during their 2025 Analyst Days (STX at >20%, WDC at industry growth of +MSD to HSD%), and we now see potential for revenues to grow in the 35-45% range through CY28. And, given minimal incremental costs on higher revenues, we see GMs expanding towards 65% into the CY28 time frame. Layering on strong FCF generation, both companies will have substantial dry powder for repurchases after debt paydown and dividends. Putting it all together, we see STX/WDC CY28 stretch EPS goals of $64/$44. Given the outsized revenue growth, structurally higher profitability with GMs approaching 65%, we see re-rating of the HDD industry to continue, with valuations reaching a minimum of S&P-like multiple of ~22-23x. Nearer term, we highlight that in our conversations, some investors favor STX on its greater potential ability to ramp HAMR supply leading to more bits, while others prefer WDC for its ability to be more aggressive with capital returns. We like them both with the caveat that the story here is not topline growth, rather margin expansion and FCF generation.

Exhibit 9: STX CY28 Earnings Power Scenarios



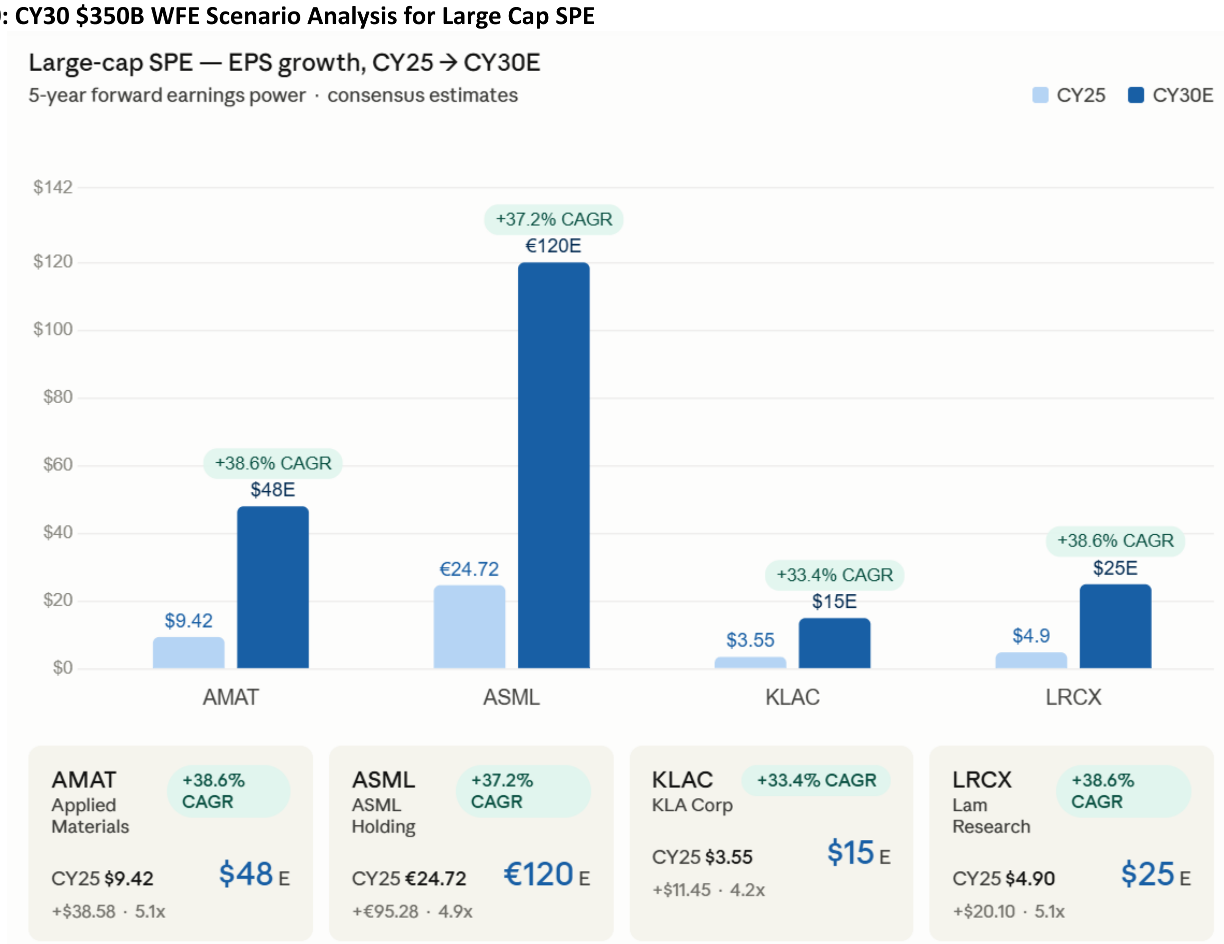
Source: Company Reports, Cantor Fitzgerald

7. Large Cap Semi Equipment is Dreaming a Bigger Dream

Semi Cap investors are increasingly excited about the trajectory of WFE through the end of the decade, and we readily agree. Led by AI, Semiconductor revenues are on a clear path to $3T in revenues by CY30 if not CY29, supportive of $300B+ in WFE. Moreover, when we reflect on a rising 2nd source in Foundry (customers desperately searching for more capacity outside of TSMC – both Samsung and Intel benefitting), a new mega-logic player entering the mix, and an expected "stronger for longer" Memory environment, it is not hard to see Semiconductor revenues of $3.5B+ into the 2030-2031 time frame. Consistent with our 9-11% WFE intensity assumption in today's AI world, this would suggest a clear path to $300-400B in WFE exiting the decade. When "dreaming the dream" of WFE in the range of $300-400B, we see stretch goal earnings power of $48 for AMAT, $15 for KLAC, $25 for LRCX, and €120 for ASML.

Nearer term, we expect results and guide this earnings cycle will be similar to last cycle – with only modest beat and raises and with ASML likely offering the most upside for CY26 – for CY26, we see the following revenues vs. consensus as most likely post report: LRCX (modeled $27.4B vs. $27.0B cons.), AMAT ($37.6B vs. $37.4B), and KLAC ($15.6B vs. $15.3B), with the exception of ASML (€42.2B vs. €39.2B). ASML is also the lone equipment company that has not already discussed CY27/CY28, resulting in potentially a combination of both near-term and out-year revisions leaving ASML the most tactically interesting name into earnings. While we favor ASML on pure earnings upside, we continue to see buying opportunities depending on investor preference for the rest of the group. AMAT remains the most optically inexpensive (36x CY27 vs. LRCX 44x, KLAC 47x, and ASML 39x), LRCX looks to be gaining the most share, while KLAC is the most defensive name in the group. In general, we continue to be "All-in" on Semi Cap as Investors begin to discount growing WFE forecasts extending out through CY30, resulting in growing earnings power for essentially every name in the ecosystem.

Exhibit 10: CY30 $350B WFE Scenario Analysis for Large Cap SPE



Source: FactSet, Cantor Fitzgerald

8. SMID Cap Semi Equipment a Beneficiary of the Dream as Well

In a world where WFE has a path to $300-400B by the end of the decade (as described in the prior section), we see ample opportunity across the SMID cap Semi Equipment group as well - and while specialists are certainly focused here today, names are still flying a bit under the radar more broadly, with greater focus on the Big 4 (AMAT, ASML, KLAC, LRCX). Here, we would highlight our coverage across Process Control (CAMT, NVMI, ONTO), Subsystems (AEIS, MKSI), and Probe Cards (FORM). Of these names, our favorite ideas today are MKSI and ONTO. For **MKSI**, the pitch is based on a few key dynamics; **1)** you want to own subsystems into a WFE upcycle and this is the "mother of all upcycles" – with inflection from this dynamic still ahead; **2)** leverage to the advanced substrate market where supply/demand is expected to remain tight for the foreseeable future, led by AI demand; **3)** rapid deleveraging offering an EPS tailwind and expanding the potential investor base; **4)** still attractive valuation and under-appreciated growth opportunity with our scenario EPS tracking to $20+/$26 in CY27/28. Add it all up, MKSI remains a Top Pick and we are increasing our price target to $600 (vs. prior $400; 25x our scenario CY28 EPS discounted back). For **ONTO**, we would also highlight a few key dynamics, including; **1)** increasing confidence on share gain opportunities across Dragonfly G5 in front-end ($1B TAM), Iris G2 in critical films ($1B TAM), 3Di, Atlas G6, etc.; **2)** upside to both Advanced Node and Advanced Packaging guide through the year (and into CY27); **3)** EPS upside from Rigaku mark-to-market accounting upon close, along with interest income from recent convert; **4)** scenario earnings power upside to $11.50+/$15.00 in CY27/CY28. Taken together, ONTO also remains a Top Pick and we are raising our price target to $410 (vs. prior $350; 30x our scenario CY28 EPS discounted back). Elsewhere, we've put together stretch goal EPS across our SMID cap coverage for CY28, and are updating our price targets accordingly, including: **AEIS** to ~$20 (price target to $450 vs. prior $400; 25x scenario CY28 EPS discounted back), **CAMT** to ~$5.50 (no change to $175 price target; 35x scenario CY28 EPS discounted back), **FORM** to ~$5 (no change to $175 price target; 38x scenario CY28 EPS discounted back), and **NVMI** to $18 (no change to $600 price target; 37x scenario CY28 EPS discounted back).

9. Long-Term Story for Teradyne Robust; Near Term More Balanced

SOC Test is expected to be strong yet again, tracking in our view to $10.0B (+32% Y/Y vs. Advantest guide of $9.1B, or +32% Y/Y), while Memory Test is on track to $1.7B+, bringing the total Semi Test market to approaching $11.7B in CY26, with risk likely to the upside. This translates into a Semi Test/WFE intensity of 8% ($11.7B/$145B), below a historical average of 12% but consistent with 2025. As we look to a future world of $250B in WFE by CY29 and potential for new entrant to drive $350B in WFE by CY30, it would be logical to see robust growth ahead for Semi Test. More specifically, a sustained 8% relative intensity would suggest a path to Semi Test of $20B by CY29 and a stretch goal of $28B in CY30. In turn, this would suggest $22 in earnings power for Teradyne in CY29 and a stretch goal of $30 in CY30.

Nearer term, we highlight somewhat aggressive consensus estimates for CY26 that will likely remain largely unchanged post earnings – thus, given the run-up, we could see some profit-taking into the report. Our work suggests AMZN Trainium biz was largely booked in 1HCY26, with next pickup expected in 1Q27, and with HBM the likely one source of upside vs. mgmt.'s thought process when they reported in April. On the other hand, we look for management to offer a vision for securing 30% share at NVIDIA over time, highlight expectations for a Google win in the 3Q time frame, and highlight Intel going merchant as incremental drivers of the medium-term story. Finally, we would also highlight MediaTek and Samsung as a likely incremental source of strength as well. So near-term numbers are likely capped, while the medium-term story remains robust, and with the 2030 story for all of Semi Test fantastic.

Exhibit 11: Semi Test as % WFE Historically

10. Mature Node Environment Set Up to Be Tight into CY27 And Beyond

Given today's backdrop of a multi-year AI-led Semi cycle, coupled with an equipment industry likely focused on leading-edge customers, we believe the non-leading-edge manufacturing market will become increasingly tight into the 2H of the current decade. Full-stack AI solutions simply require more than just leading-edge silicon, with a large number of chips manufactured on mature node processes (power management, voltage regulators, gate drivers) dominating data center floor space, while increasingly becoming short in supply. Add in the fact that TSMC is converting mature node capacity to support advanced packaging needs and it becomes a perfect environment for mature node foundries to exercise pricing power, as increased demand is faced with lower supply. We have already seen the early signs of this shortage with UMC and Vanguard announcing price hikes in the 2H26, and we expect this to only accelerate in 2027 and beyond. As a result, we do look for both utilizations and pricing to improve over the coming quarters and years in both mature node foundry (GFS) and in Analog. Specific to GF, we note that the company has already discussed raising pricing on a select portion of its portfolio (not under LTA) in the 2H, and is requiring pre-payments for specific supply-constrained corridors (SiPho + GaN). With that said, we continue to see earnings upside near term for GF, with a small beat and raise on the June/September Qs on continued CID growth, coupled with the aforementioned improvement in pricing and utilization. Additionally, the premium smartphone market looks to be holding up a little better than feared (though coming price hikes from Apple could signal a change in CY27), but we believe that GF signaling SMD down 10% in CY26 (and flat through CY30) largely de-risks estimates. The main question mark is in Automotive where GF has a major customer that requests the end of half deliveries, resulting in a large sequential uptick in the June Q, followed by a step-down in September. If we model an ~11% Q/Q decline in September (from ~$450M In June), we see revenues coming in ~$400M, which should support ~$1.90B in topline (cons. $1.875B).

Longer term, with worries of CPO delays at TSMC, we note that GF's $1B in exit-rate CY28 SiPho revenues assumes essentially all pluggable transceiver revenue and we believe that target remains 100% intact (if not a touch conservative). Outside of SiPho, GF has plenty of shots on goal to support upside to numbers, with GaN, TIA drivers, SatCom, and Automotive supporting upside to CY27 and CY28 estimates. When looking at valuation, today GF trades far closer to mature node peers in Asia than SiPho competitor, TSEM. While we fully appreciate TSEM's market-leading position in SiPho (and excellent earnings visibility to CY27), we look for GF to continue to re-rate perhaps not to the same multiple, but at least in a similar neighborhood as TSEM.

Stretch Goal Earnings into CY28/29 Across Our Coverage

Exhibit 13: Stretch Goal Earnings

Ticker	Stock Price	Stretch EPS	Current P/E	Stretch EPS Methodology
Compute / Networking				
NVDA	$200	$21	9.5x	We continue to see $15-16 in EPS in CY257, followed by $20-22 in CY28
QCOM	$204	$16	12.5x	FY29 Target model is $18+ in EPS; to equate to 2028 we discount by 1yr to derive ~$16
AVGO	$380	$30	12.7x	AVGO remains on track for $24-25 in CY27 (cons $20.51), and we see stretch goal of $30+ in CY28 (cons $25)
AMD	$520	$28	18.6x	We see $60B in combined server CPU/XPU revs in CY27, followed by additional 30+% growth in CY28 supporting path to $28
INTC	$132	$6	22.0x	Supported by DCAI growing ~4x led by Agentic AI, $12B+ in AP/Foundry revs, see path to $6 in EPS in CY30 as Stretch Goal
MRVL	$279	$10	27.9x	Assuming 40+% sustained topline growth in CY26/27/28 (led by CY28 IPHI/Custom Silicon $18B) Supports Path to $10 in CY28 EPS
Analog				
NXPI	$299	$20.50	14.6x	CY28 EPS upside to $20.50 supported by analysis of "normalized" cyclical revs + AI/DC secular growth
MCHP	$93	$6	15.5x	CY28 EPS upside to $6 supported by analysis of "normalized" cyclical revs + AI/DC secular growth
ON	$117	$6	19.5x	CY28 EPS upside to $6 supported by analysis of "normalized" cyclical revs + AI/DC secular growth
ADI	$407	$20	20.4x	CY28 EPS upside to $20 supported by analysis of "normalized" cyclical revs + AI/DC secular growth
TXN	$304	$12.50	24.3x	CY28 EPS upside to $12.50 supported by analysis of "normalized" cyclical revs + AI/DC secular growth
Memory/Storage				
MU	$1,052	$200	5.3x	With DRAM/NAND tightness to only get worse into CY27 and S/D tight for all of CY28, we see CY28 stretch goal of $200
SNDK	$1,964	$250	7.9x	Assuming 3-digit ASP increase in 3Q followed by relatively flattish pricing (to reflect LTAs), we see path to $250+ in CY27
WDC	$671	$44	15.4x	We see CY28 stretch goal EPS at 65% GM and 35-40% topline CAGR of $39-48
STX	$1,038	$64	16.2x	We see CY28 stretch goal EPS at 65% GM and 35-40% topline CAGR of $58-70
Large Cap Semi Cap				
AMAT	$586	$48	12.2x	Earnings Potential into $350B WFE Blue Sky Scenario for CY30
ASML	€ 1,778	€ 120	14.8x	Earnings Potential into $350B WFE Blue Sky Scenario for CY30
LRCX	$371	$25	14.9x	Earnings Potential into $350B WFE Blue Sky Scenario for CY30
KLAC	$244	$15	16.3x	Earnings Potential into $350B WFE Blue Sky Scenario for CY30
SMID Cap Semi Cap				
MKSI	$389	$26	15.0x	We see CY28 EPS upside to $26 with WFE growing at a ~30% CAGR through CY28
AEIS	$365	$20	18.2x	We see CY28 EPS upside to ~$20 on strength across Semis and DC Power
ONTO	$316	$15	21.1x	CY28 EPS upside to $15 supported by share gains on new product ramps
NVMI	$528	$18	29.3x	We see CY28 EPS upside to $18 with WFE growing at a ~30% CAGR through CY28
CAMT	$169	$5.50	30.8x	We see CY28 EPS upside to $5.50 with AP growth accelerating in CY27/28
Test & Packaging				
TER	$420	$26	16.2x	WFE $250B/$350B would suggest relative EPS power of $22/$30 into CY29/30
FORM	$143	$5	28.6x	We see CY28 EPS upside to ~$5, achieving the target model 2yrs ahead of plan
Foundry				
GFS	$83.27	$4.00	20.8x	We see $4.00 in EPS for GFS exiting CY28 led by SiPho, GaN, and Sustained Growth Elsewhere (Auto/Physical AI)

Analyst Certification

The analysts primarily responsible for this research report, and whose names appear on the front cover, certify that: (i) all of the views expressed in this research report accurately reflects his or her personal views about any and all of the subject securities or issuers featured in this report; and (ii) no part of any of the research analyst’s compensation was, is, or will be, directly or indirectly related to the specific recommendations or views expressed by the research analysts in this report.

Legal Disclosures

For important disclosures on companies mentioned in this report, please contact the Cantor Fitzgerald Research Department at 110 East 59th Street, New York, NY 10022, or refer to this website:https://cantor2.bluematrix.com/sellside/Disclosures.action

Cantor Fitzgerald's rating system

Overweight/OW: We expect the stock’s total return to exceed 15% over the next 12 months. For the purpose of calculating the percentage of subject companies within the Buy, Hold, and Sell categories for whom Cantor Fitzgerald has provided investment banking services within the previous 12 months, an Overweight rating equates to a Buy rating.

Neutral/N: We expect the stock’s total return to be between -10% and 15% over the next 12 months. For the purpose of calculating the percentage of subject companies within the Buy, Hold, and Sell categories for whom Cantor Fitzgerald has provided investment banking services within the previous 12 months, a Neutral rating equates to a Hold rating.

Underweight/UW: We expect the stock’s total return to fall below -10% over the next 12 months. For the purpose of calculating the percentage of subject companies within the Buy, Hold, and Sell categories for whom Cantor Fitzgerald has provided investment banking services within the previous 12 months, an Underweight rating equates to a Sell rating.

Not Covered/NC: Cantor Fitzgerald does not provide an investment opinion or does not provide research coverage on this stock.

Not Rated/NR: We are not currently carrying a rating on this stock. Rating and estimates are under review. The NR rating does not equate to an Overweight, Neutral, or Underweight rating and thus is not counted in the calculation of the percentage of subject companies within these three categories for whom Cantor Fitzgerald has provided investment banking services within the previous 12 months.

Performance parameters should be interpreted flexibly as general guidelines relating to performance over a twelve-month period and are not intended to be influenced by short-term share price volatility. Performance in this context is evaluated in terms of total absolute return.

Total return is defined as the sum of (1) the percentage difference between the target price and the current price and (2) the expected dividend yield of the stock.

As a result, this report has not been prepared subject to Canadian Disclosure requirements. Cantor Fitzgerald Canada may distribute research reports prepared by its affiliates.

Risks

The financial instruments discussed in this report may not be suitable for all investors and investors must make their own investment decisions based on their specific investment objectives. Past performance should not be taken as an indication or guarantee of future performance. The price, value of and income from, any of the financial instruments featured in this report can rise as well as fall and be affected by changes in economic, financial and political factors. If a financial instrument is denominated in a currency other than the investor's currency, a change in exchange rates may adversely affect the price or value of, or income derived from, the financial instrument, and such investors effectively assume currency risk. In addition, investors in securities such as ADRs, whose value is affected by the currency of the home market of the underlying security, effectively assume currency risk.

Distribution of Ratings/Investment Banking Services (IB) as of 06/29/26
